Dear Sir

Re: The Lakes Stage 3I
Noise Control Guidelines to Dwellings

As requested, we have carried out an assessment of the noise control treatment required to the dwellings constructed within Stage 3I of ‘The Lakes’ residential development (Pakanga Grove).

Our findings and recommendations are set out below.

1.0 Background Information

In relation to the development of the Stage 3I subdivision and the control of noise from the neighbouring State Highway 36 (Takitimu Drive):

- The subdivision is protected from noise from vehicles on the Highway, to help avoid a ‘reverse sensitivity’ issue arising. This is achieved by the construction of a 2.4m high noise barrier on the southern side of the Stage 3I subdivision.
- The noise modelling and details of the barrier were set out in the report from Hegley Acoustic Consultants, dated 20 April 2016.
- The requirements of Rule 4E.2.5 of the Operative Tauranga City Plan were adopted for the Hegley assessment. This Rule specifies that:

  For properties within the NZTA (New Zealand Transport Agency) Reverse Sensitivity Plan Area shown on the Plan Maps (Part B):

  i) Any new dwelling shall meet an internal road-traffic design sound level of 40dB LAeq(24h) inside all habitable rooms with ventilating windows open.

- The noise barrier was designed to mitigate noise from the State Highway. Where the level outside the façade is 55 dBA Leq24hr or less, no further acoustic treatment is required. This is because research has shown that a typical outdoor-to-indoor noise reduction of 15 dBA is achieved with windows open ajar for natural ventilation.
The Hegley report showed that this may not be achievable for some dwellings built near to the Highway. For example, any barrier would need to be excessively high to achieve 55 dBA at some lots adjoining the Highway. On this basis, an acoustic design is required for dwellings on these Lots, setting out the noise control treatment that is required to the ‘building envelope’ of the dwelling. The treatment would be designed to achieve 40 dBA within bedrooms and other ‘habitable rooms’ within the dwelling.

The Rule of the City Plan specifies that if compliance with the internal noise limit can only be achieved with windows/external doors to the habitable room closed, then an alternative means of ventilation is required ie. a mechanical ventilation or air conditioning system.

We have visited the subject site and carried out noise measurements across the subdivision. With this information, we have assessed the likely noise control treatment to dwellings on all lots, to satisfy the City Plan Rule.

2.0Noise Control Treatment Guidelines

The attached guidelines are provided to assist with the design of dwellings on the stage 31 Lots. Potential owners/developers of these Lots can determine the likely cost impact (if any) at an early stage and design the building appropriately.
Dwellings in Areas A and B, on the southern side of the development near to the Highway, require acoustic treatment to the building envelope and a mechanical ventilation system.

Dwellings in Area C do not require treatment to the building envelope, but they may require a mechanical ventilation system.

Note that no treatment is required to dwellings in Area D on the northern side of the development.

We trust this information is satisfactory. Please do not hesitate to contact us if you have any questions.

Yours faithfully,

Design Acoustics Ltd

Tony Windner
Director
The Lakes Subdivision, Stage 3I
Noise Control Guidelines

1.0 Introduction

The following guideline recommendations should be implemented, so that the acoustic requirements of the City Plan are achieved. In general, the requirement is that the noise level inside habitable rooms within the dwelling, due to traffic on the adjoining State Highway, shall not exceed 40 dBA Leq24hr.

Note that the following applies to habitable rooms only. A ‘habitable room’ includes bedrooms, living, an office or study area, but not to any other service or transit area (eg. bathrooms, laundry, garage, corridor etc).

2.0 Assessment

The noise level inside habitable rooms depends on many factors. These include the external noise level and spectral/frequency content (varies throughout the day and night), the effect of any fence/barrier on the boundary, the types of building materials, the room layout, areas of walls, windows and doors, volume of rooms and the amount/type of sound absorbing materials inside the room (furnishings, drapes etc).

We have carried out an assessment of the noise control treatment required to achieve the internal noise criterion. Our assessment of the noise control treatment has included our best engineering estimates of the many variables associated with calculation of noise inside buildings.
3.0 Noise Control Recommendations

The degree of noise control treatment to dwellings depends on its location within Area A, B, C as shown below. No treatment is required to dwellings on Lots within Area D (as shown below and other Lots to the north in Stage 3I):

![Map of noise control areas]

3.1 Area A

The following applies to habitable rooms of dwellings on:
Lots 585 to 588
These Lots are located on the south-western side of the development, near SH36.

For dwellings on these Lots, treatment to the 'building envelope' is required and an acoustic design certificate shall be submitted. The certificate shall by prepared by a suitably qualified and experienced acoustic consultant.
3.1.1 Single-storey dwellings

Habitable rooms on single level dwellings shall be checked for compliance with the following recommendations for noise control treatment. See Table 1 below.

A mechanical ventilation system is required to habitable rooms in a single-storey dwelling on these Lots. A producer statement may be required in relation to the provision of a mechanical ventilation system.

3.1.2 Two-storey dwellings

Lower floor

Habitable rooms on the lower floor of two-storey dwellings shall be checked for compliance with the following recommendations for noise control treatment. See Table 1 below.

A mechanical ventilation system is required to habitable rooms on the lower floor of a two-storey dwelling on these Lots. A producer statement may be required in relation to the provision of a mechanical ventilation system.

Upper floor

Habitable rooms on the upper floor of two-storey dwellings shall be checked for compliance with the following recommendations/noise control treatment, as shown on Table 2 below. Noise levels are higher at the upper floor and more noise control treatment is required.

All habitable rooms on the upper floor will require a mechanical ventilation system in accordance with the City Plan Rule. (See Table 2 attached). A producer statement may be required in relation to the provision of a mechanical ventilation system.
3.2 **Area B**

The following applies to habitable rooms of dwellings on:
Lots 577 to 584
These Lots are located on the south-eastern side of the development, near to the Highway.

3.2.1 **Single-storey dwellings**
Single storey dwellings on these Lots do not require any specific noise control treatment to the ‘building envelope’.
However, a mechanical ventilation system is required to habitable rooms. The ventilation system requirements are shown on the attached Tables.
An acoustic design certificate is not required for single storey dwellings within Area B, however a producer statement may be required in relation to the provision of a mechanical ventilation system.

3.2.2 **Two-storey dwellings**

**Lower floor**
Habitable rooms on the lower floor of dwellings in this category do not require any specific noise control treatment to the ‘building envelope’.
However, a mechanical ventilation system is required to habitable rooms. The ventilation system requirements are shown on the attached Tables.
A producer statement may be required in relation to the provision of a mechanical ventilation system.

**Upper floor**
Habitable rooms on the upper floor of two-storey dwellings shall be checked for compliance with the following recommendations/noise control treatment. See Table 1 below.
A mechanical ventilation system is required to habitable rooms. The ventilation system requirements are shown on the attached Table 1.
A producer statement may be required in relation to the provision of a mechanical ventilation system.
3.3 **Area C**

The following applies to habitable rooms of dwellings on:

Lots 504 to 512

Lots 572 to 576

3.3.1 **Single-storey and two-storey dwellings**

Dwellings on these Lots do not require any specific noise control treatment to the ‘building envelope’.

However, a mechanical ventilation is required to habitable rooms on these Lots. The ventilation system requirements are shown on the attached Tables.

An acoustic design certificate is not required for dwellings within Area C, however a producer statement may be required in relation to the provision of a mechanical ventilation system.

3.4 **Area D**

Single-storey or two-storey dwellings on these Lots do not require any specific noise control treatment to the ‘building envelope’ nor is a mechanical ventilation system required. The Lots within Area D are:

Lots 513 to 521

Lots 522 to 539

Lots 540 to 571

These Lots are located on the northern side of the development, further from the Highway.
Table 1

Noise Control Treatment/Ventilation to Habitable rooms

- **Area A** – Single Level Dwellings and Lower Level of Two-storey Dwellings
- **Area B** - Upper Level of Two-storey Dwellings

The following Table 1 applies to habitable rooms in Area A (single level and lower level of two-storey dwellings) and Area B (upper level only).

</table>
| Habitable rooms    | A ventilation system shall be installed comprising the following components and specifications:  
(a) An air conditioning system provided that the noise level generated by the system does not exceed 35 dB LAeq30secs in bedrooms and 40 dB LAeq30secs in all other habitable rooms, when measured 1 metre away from any grille or diffuser;  
OR  
(b) ▪ A mechanical ventilation system providing at least 15 air changes per hour in living/dining areas, and at least 5 air changes per hour in all other habitable rooms, and;  
▪ Noise must not exceed 40 dB LAeq30secs in the living/dining area, and 35 dB LAeq in all other habitable rooms when measured 1m from any grille or diffuser, and;  
▪ Internal air pressure must be no more than 10Pa above ambient air pressure due to the mechanical ventilation, and;  
▪ Where a high air flow rate setting is provided, the system must be controllable by the occupants to be able to alter the ventilation rate with at least three progressive stages (ie. low/medium/high speed). | See Figure 1 detail (q).  
Option (a) may be achieved by ducted air conditioning unit with fresh air supplement. Minimum ventilation requirements of Section G4 of the NZ Building Code shall apply.  
Option (b) may be achieved by a ‘low-noise’ or acoustically treated supply fan in ceiling cavity, with minimum 1.5 metres of acoustic flexible duct on each side of the fan. Split system heat pumps are desirable for thermal control.  
A mechanical ventilation system may not be required if the habitable room has a north-facing window/s, with openable area at least 5% of the room’s floor area and/or complies with Section G4 of the NZ Building Code. |
